Dear Hiring Team,

I am applying for Senior Full Stack Developer in Berlin. Your production stack (TypeScript and Node) is the backend I actually write, sitting next to a long React/TypeScript frontend career. I want a role that treats that combination as the job, not as a frontend person who also touches tickets.

Most recently at Zühlke I built a one-command Node CLI that stands up a full multi-service stack with Docker, WireMock, and LocalStack so GIC developers could stop waiting a week for a shared UAT. That is the kind of tooling problem I like: make the real system runnable, then make the tests honest. Before that I spent three years on a consumer loyalty product at Ascenda (React, Next.js, checkout, accessibility) and led small teams through messy delivery, including a three-month rail defect platform at Alstom.

I am a senior frontend engineer by depth, fullstack by direction. I will not oversell Java or Kotlin. I will over-index on TypeScript, Node, production quality, and teaching other engineers how to test. I am in Singapore, ready to relocate to Berlin, and I will need visa sponsorship. Your relocation support is one reason I am applying here among TypeScript shops.

Thank you for reading.
