23 August 2026 · Personio · Senior Software Engineer – Backend / Fullstack · Munich or Berlin

Dear Hiring Team,

I am applying for the Senior Software Engineer (Backend / Fullstack) role. I am a senior engineer in Singapore with nine years of product work, mostly on the frontend: React and TypeScript at production scale. I am deliberately moving into more of the stack, and Personio is the kind of product I want to do that on: HR and payroll software that companies actually run, not a slide-deck platform.

What I would bring on day one is the frontend half of this job, at senior level. At UBS I led a React/TypeScript micro-frontend migration from Create React App Module Federation to Vite after two banking platforms merged, and I shipped compliance features (client-circumstance changes, document-expiry alerts) on an unfamiliar codebase in the first week. At Ascenda I designed checkout and redemption flows for bank and card partners, then a Next.js self-serve admin so enterprise clients could launch their own branded experiences. I care about accessibility, feedback loops, and tests: I drove a company-wide Cypress/Playwright strategy that cut escaped bugs by about 40%.

The backend half is the growth I am hiring myself into. Recent work is already there: a one-command Node CLI and Docker/LocalStack/WireMock environment so a GIC .NET platform runs on a laptop; Keycloak auth and a Grafana/Loki stack on a rail product at Alstom; Python/FastAPI services earlier for a GIC market dashboard. I am not a long-tenure Kotlin/Spring specialist. I am a strong senior frontend engineer who already owns APIs, auth, and developer tooling, and who wants a fullstack seat where that mix is the job.

I am based in Singapore and ready to relocate to Munich or Berlin. I will need visa sponsorship (EU Blue Card). I am happy to talk through how I would ramp on your backend conventions in the first months.

Thank you for reading.
