23 August 2026 · Redcare Pharmacy · Senior Fullstack Engineer · Berlin

Dear Hiring Team,

I am applying for Senior Fullstack Engineer in Berlin. The stack on the posting is the closest match I have seen in this search: React, Next.js, Node, and TypeScript. That is the work I have been paid to do for most of the last nine years, and I want a seat where I keep doing it while owning more of the services behind the UI.

At Ascenda I led a three-person team to a loyalty-as-a-service MVP in three months, then designed checkout across multiple redemption types and a Next.js platform so bank and fintech clients could configure their own branded experiences. At UBS I migrated a React/TypeScript micro-frontend from CRA Module Federation to Vite and shipped production compliance features in week one. I treat tests as part of the product: Cypress and Playwright, not a QA afterthought.

I am honest about the split. I am primarily a frontend engineer moving into fullstack. The Node, Python, auth, and observability work is already on my resume (Zühlke local-dev CLI, Alstom Keycloak/Grafana, GIC FastAPI). I am not stretching this into a Java-only backend story. Redcare looks like a place where that honesty is an advantage.

I live in Singapore and I am ready to move to Berlin. I will need an EU Blue Card. Thank you for considering the application.
